

iProMOH

The iProMOH is an IP based digital announcer specifically designed for message/music on hold (MOH) and overhead messaging applications. The iProMOH is available either as a single site unit managed via a network connection from a PC, or multi-site solution managed remotely via the internet from a host system, with the optional iCAS administration software.

AMS can provide all creative writing and professional message and music content for end user deployment. If preferred, AMS will manage the entire process from content to distribution to ongoing support.

Models with dual independent outputs are available for two unique outputs to the phone system or one for MOH and one for overhead messaging to the PA system, all from one unit.

IP Based Digital Announcer

Features include:

- Accepts .wav, mp3, .mid, & wma files
- Single channel unit: 60 minute capacity
- Dual channel unit: 180 minute capacity
- Background music input
