

PlayNetwork Media Player

The PlayNetwork Media Player is a hard drive store-and-play system that advances the many ways music can be controlled, distributed, and played to enhance the overhead and on hold music and messaging experience. This versatile system is capable of storing thousands of digital quality songs on its hard drive. Added flexibility comes with the ability to receive, store, and play custom branded music delivered via Internet connection or from CD-ROM uploads. This is especially useful to facilitate efficient content management and deployment. The dual channels are ideal for broadcasting different audio to specific store zones or to the phone system for on hold music and messaging.

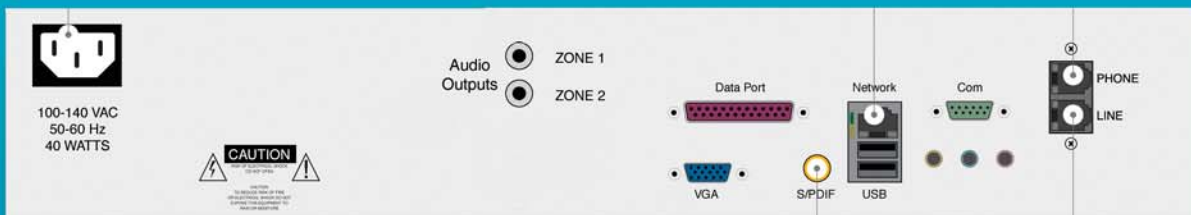

The Media Player also incorporates unique playback capabilities including random song shuffling and playback for added variety, consistent volume balance, and program rich mixing. This solution is a practical, high-performance digital music system that enables leading brands to extend the reach of their in-store and on hold experience for their customers.

Overhead Music & Messaging

Features include:

- Internet or CD distribution methods
- One or two zone simultaneous playback
